

Checkout Cessna Pilot's Association's upcoming R/TR182 Course below. We have attended and find the course content to be excellent – it will save you many times the cost of the course in maintenance & operations.

Best of all course instructor Paul New is an expert on the type and keeps the discussion fun, and light even when the content in the intensive 2-day immersion course gets serious. You'll refer to the syllabus frequently during operations and maintenance of your R/TR182. <https://cessna.org/shop/courses/systems-course/in-person/r-tr182-systems-procedures-course-1978-1986-models-september-6-8-2024-corona-ca/>

It's been several years since we last held courses on the West Coast. If you own, fly, or maintain any of the R/TR182 models, you don't want to miss out on this course. This course has been expanded to two and a half days. The course covers the details of

every system in the aircraft: flight controls, electrical, hydraulic, fuel, pressurization, propeller, power plant and engine management. Paul New will also present his tactical and strategic engine data analysis.

Paul New will be your instructor for this class. Paul holds an FAA Airframe & Powerplant Certificate with FAA Inspection Authorization. He was an FAA Designated Airworthiness Representative for a few years as well. In 2007 he was selected as the FAA National Aviation Maintenance Technician of the Year.

This is a ticket to the live, in-person event in Corona, CA, September 6-8. There are no virtual or other video options for this event.
